

ESTA 2013 Upgrades

Posted by estapete - 27 Jan 2013 19:06

I am pleased to announce that after a few months of meetings, surveys, etc. that we have secured the funds to replace our aging concrete starting line and complete a few other projects that we have been meaning to get to. We'll get started as soon as the weather permits. We'll have more info at our Driver's meeting which we should have scheduled very soon.

Pete

Actually, concrete cures harder under water, so if we have to have rain, 2 days to 30 days after the pour will be beneficial.

Ronno- 1320' is all I have heard for Pro. EXCEPT Turbo sleds, which is 660' per NHRA Rules. Not sure about Trophy Sled/Bike. I dont think a final decision was made on that. I personally think that would be the best decision, giving both sides of the aisle a class to race comfortably, and also give the turbo sleds a place to race.
